

# Short Write-up

## 1. Business Questions Prioritised and Why

While working on this assessment, my main goal was to understand how the loan portfolio is performing and where the risky areas are.

First, I looked at the overall portfolio by checking total disbursed amount, total outstanding, total overdue, active accounts, and NPA accounts. I wanted to get a clear idea of how much business has been done and how much amount is still pending or risky.

Then I focused on overdue loans using DPD buckets and NRB classifications because they show how delayed the payments are and which loans may become a bigger problem in the future.

I also checked product-wise performance because every loan product behaves differently. This helped me understand which products are doing better and which products have higher default rates.

After that, I worked on the collections side by analysing collector-wise overdue accounts, overdue amounts, contact gaps, and collection efficiency. I wanted to see how well overdue loans are being followed up and recovered.

Lastly, I looked at branch and customer-level data to understand repayment behaviour in different locations and customer groups.

I focused on these areas because together they give a proper picture of business performance, risk, and recovery.

management in decision-making for risk control, product strategy, and recovery planning.

## 2. DAX Measures I Am Particularly Proud Of

While building the dashboard, some measures were very helpful for me:

- **NPA Rate %** – to find out how many accounts have become non-performing.
- **Collection Efficiency %** – to check how much EMI has been collected compared to how much was due.
- **DPD Bucket** – to group overdue loans based on delay days.
- **Days Since Last Contact** – to see how recently overdue customers were contacted.
- **Prepayment Rate %** – to identify customers who cleared their loans early.
- **Contact Coverage %** – to check whether overdue customers are being followed up.

These measures made it easier for me to understand the data and create meaningful visuals.

### **3. One Interesting Insight**

One thing I found interesting was that the Mobile Phone category had the highest NPA rate, around 64%, even though it was not one of the top disbursed products. This showed me that even smaller loan products can have higher repayment risk.

Another thing I noticed was that the highest overdue amount was in the 180+ DPD bucket, around NPR 1.07 billion. This means many customers have delayed their payments for a long time, which can make recovery more difficult.

I also saw that contact coverage for overdue accounts was 100%, which means the collection team has been regularly following up with overdue customers.
